Identified Site

0 200 400 600 800 1,000 Feet

High Consequence Area
(HCA)

0 200 400 600 800 1,000 Feet

HCA Identification Safety Issues

- Reporting requirements
- Positional accuracy and buffering
- Authoritative sources for geospatial data

Reporting Requirements

- HCA identification frequently cited in inspections
 - Highest percent of collected civil penalties
- Operator incident reports do not verify HCA identification
- Operators not required to submit HCA data to NPMS

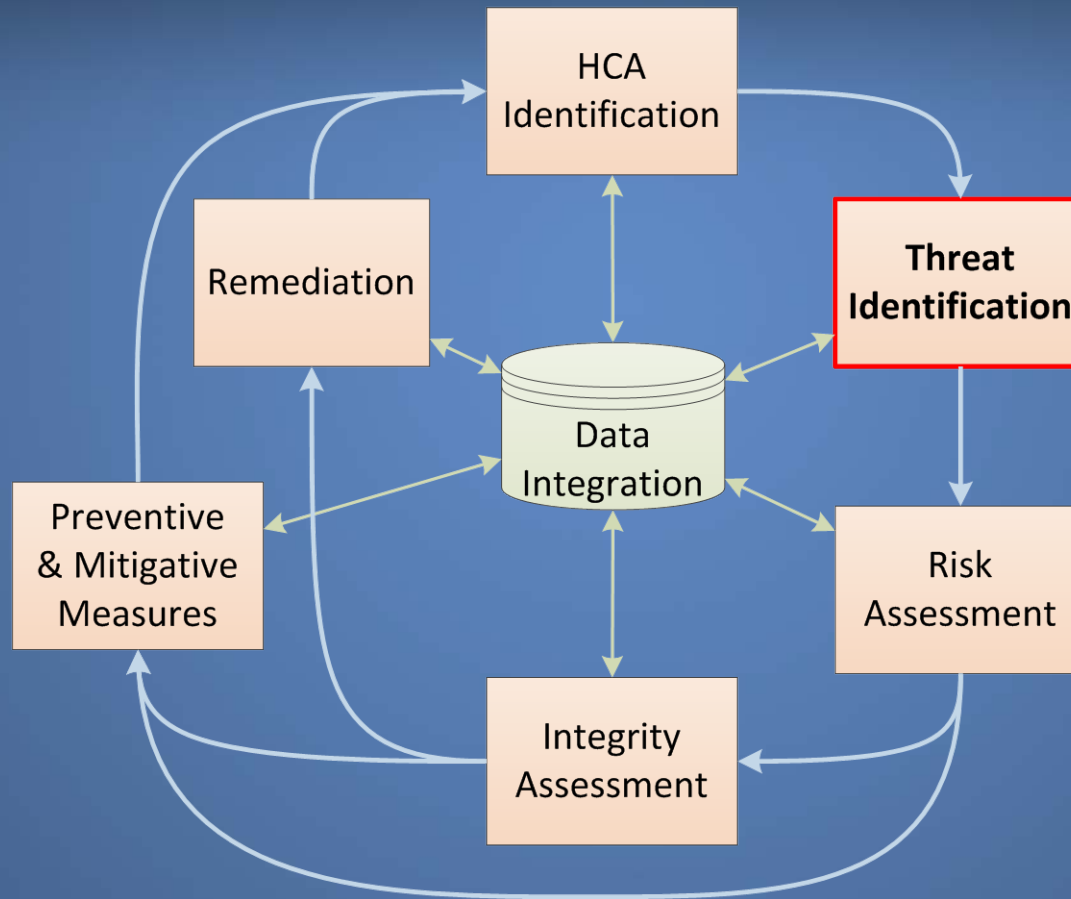

Positional Accuracy and Buffering

- Operators must account for mapping/measuring inaccuracies
 - Most interviewed operators add a distance buffer to PICs, but approaches vary
- No standards for geospatial data commonly used by pipeline industry
- Lack of standards limits operators' ability to determine technically sound buffers

Authoritative Sources for Geospatial Data

- Errors in determining Identified Sites are a frequent compliance issue
 - Palm City, FL
- No national repository for geospatial data used in HCA identification
- Lack of authoritative data source may contribute to inaccurate HCA identification

Threat Identification

Threat Categories

- Time-Dependent
 - External Corrosion
 - Internal Corrosion
 - Stress Corrosion Cracking
- Stable
 - Manufacturing
 - Construction
 - Equipment
- Time-Independent
 - Third-Party / Mechanical
 - Incorrect Operations
 - Weather-Related / Outside Forces

External Corrosion

Manufacturing (bad weld)

Third-Party (dents)

Source: PHMSA, NTSB

Threat Identification Safety Issues

- Elimination of Threats
- Interactive Threats

Elimination of Threats

- “Elimination” does not remove threat
 - Operator assumes threat not present
- Approaches vary among operators
 - Flowcharts
 - Decision trees
 - Statistical tests on risk model outputs

State Inspection Difficulties: Threat Identification

Source: NAPSR

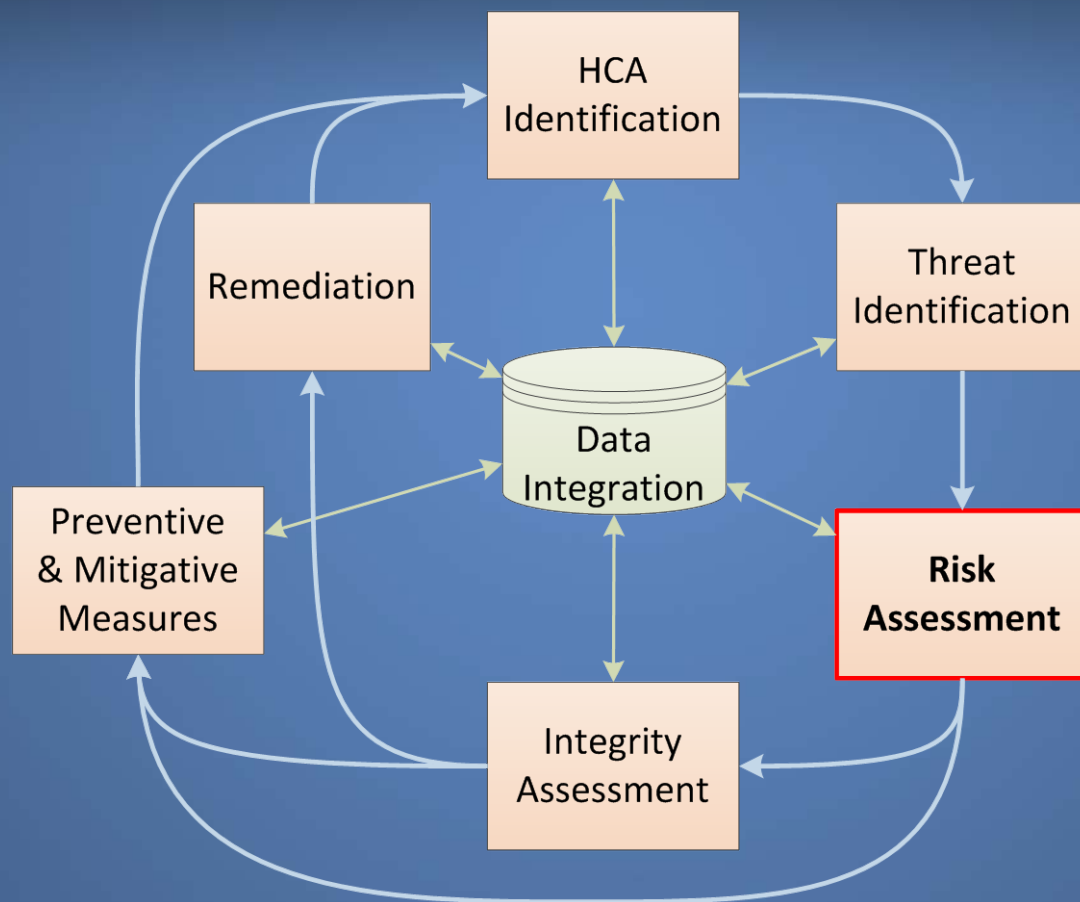

Elimination of Threats

- Factor in Palm City, FL accident
- Lack of data precludes thorough analysis
- Threat elimination compliance issues cited in 30% of PHMSA IM inspections
- Little guidance available to operators or inspectors

Interactive Threats

- Interactive threat compliance issues cited in 51% of PHMSA IM inspections
 - Most frequent issue cited
- Approaches vary among operators
- Insufficient guidance available
 - How to evaluate interactive threats
 - What threat interactions to consider
- Lack of data precludes thorough analysis

Risk Assessment

Risk Assessment Safety Issues

- Safety performance of risk models
- Risk modeling guidance
- Professional qualification standards

Risk Models

- Risk = Likelihood × Consequence
- Four types of models allowed
 - Subject matter expert (SME)
 - Relative risk
 - Scenario-based
 - Probabilistic (absolute risk)
- Most operators' models most closely resemble relative risk model

Risk Model Performance

- Operators considering probabilistic models
 - Data-intensive
 - Have advantages over relative risk models
- Insufficient guidance regarding relative safety performance of each model type
- Lack of data precludes analysis of risk model effects on accident occurrences

State Inspection Difficulties: Risk Assessment

Source: NAPSR

Risk Modeling Guidance

- Weighting factors
 - Indicate relative importance of risk factors
 - System-wide weighting factors can obscure uncommon, but high-risk threats
- Risk metrics and risk aggregation
 - Operators often aggregate risk from segment to HCA level
 - Metrics may mask localized threats

Professional Qualification Standards

- Engineers and SMEs play large role in risk model design, implementation, and validation
- Professional qualification standards are often inadequate
- Example: risk validation role
 - No required training beyond IM familiarity
 - No required math or statistics knowledge
